

Identification and Management of Upper- and Lower-Limb Spasticity
and Muscle Overactivity in Upper Motor Neuron Syndrome:
A Hands-on Approach

Dear Participant:

Welcome to the NeuroRehab Clinical Consult Program entitled *Identification and Management of Upper- and Lower-Limb Spasticity and Muscle Overactivity in Upper Motor Neuron Syndrome: A Hands-on Approach*.

This program is a continuing medical education mentoring initiative for practicing neurologists and physiatrists on the management of spasticity and other conditions that result from motor activity dysfunction.

This program offers you a unique, hands-on opportunity to be mentored by a preceptor who is a specialist in treating spasticity and related conditions. An Educational Compendium has been developed to improve your skills with differential diagnosis and identifying treatment options for appropriate patients. Protocols for various pharmacologic therapies for spasticity and muscle overactivity are also reviewed.

Using the Patient Qualification and Selection Checklist, you have selected several patient cases to discuss with your preceptor during the Clinical Consult session. Your preceptor can provide you with recommendations for various treatment modalities, including chemodenervation agents.

Thank you for your participation in this innovative program.

Sincerely,

David Simpson, MD, FAAN
